

Scientific Studying: Substantially Increasing Your Learning Power Through Scientific Experiments

The ability to learn is one of the most important skills we have. What if we could substantially improve it with a simple, customized, scientific methodology? This is the objective of this book. The way one studies is often the result of a number of inputs learned unconsciously and applied mechanically since early childhood. Through personal observation, a student often emulates the way an older sibling or a classmate studies. Are these methodologies optimal? Unfortunately, traditional study methods generally involve a high level of waste, which can be reduced or eliminated when studying techniques developed through scientific experiments are employed. After conducting experiments, Marco Pasteris MBA and Stanca Somesfalean PhD proved that through the application of Scientific Studying it is possible to achieve an increase in learning power by 50 percent in only a few months. The chapters in this book describe the underlying philosophy of Scientific Studying and most importantly, provide concrete examples of its application. Subsequently, readers will easily acquire all they need to apply Scientific Studying and improve their learning skills through a self-designed and self-administered series of scientific experiments. Students from middle school to graduate level as well as teachers, university professors, parents, researchers, executives, and managers will find this ground-breaking book invaluable, motivating, and extremely easy to use.
